www.castlecomposites.co.uk

Castle Composites Ltd are pleased to introduce our range of ASLON Protection Pads. ASLON Protection Pads can be used on flat roofs and balconies as protection pads for many applications, some of which are listed below. Manufactured from recycled SBR rubber they offer an anti-slip protection surface that is also very effective for noise reduction. Standard pad size 100x100x10mm, larger pads available on request.

Flat Roof & Balcony Paving

ASLON Protection Pads can be used to lay paving on flat roofs and balconies. As well as offering excellent protection to the waterproofing they raise the paving above the membrane to allow for drainage. ASLON shims can also be used to adjust over slight undulations. We recommend the use of our Promenade Slabs which are fully tested to BS1339 for use on support pads.

Timber Decking

Suitable for use when laying timber decking on flat roofs or balconies. The pads protect the waterproofing, support and raise the joists to allow water to drain and can substantially reduce transmitted noise levels.

Solar Panels

ASLON Protection Pads are commonly used under solar consoles and solar panel frames to protect the waterproofing surface from damage from point loading & vibration. As the pads are anti slip they also help to keep consoles in position.

The applications listed above are only a fraction of the uses for ASLON Protection Pads.

Please feel free to contact us if you have further questions on their suitability.
